

Mapty Project

INTRODUCTION:

The project helps the users to keep track of their daily workouts of either cycling or running.

The user can mark a marker on the rendered map and assign it as a cycling or a running exercise. Moreover, the user can also specify the duration, kilometers exercised etc. as could be seen in the above picture.

HOW TO USE:

- 1) Open the project and allow the application to use your current location. A hand cursor would appear while the user hovers over the map.
- 2) Tap the map with the hand cursor and a form would appear which would allow the user to fill in the details of the exercise.
- 3) The history of the exercises marked would be stored in the user's chrome's temporary storage and could be accessed even after the application is closed.
